

# Basis for the division of photovoltaic project energy storage areas

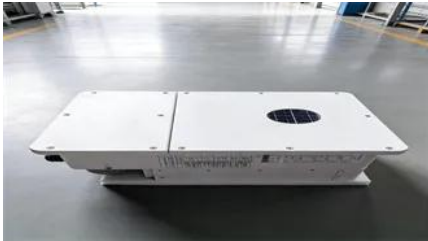

## Overview

---

10-B in the 2022 Building Energy Efficiency Standards list the building types where PV and battery storage are required, and the PV capacity factors for each building type in each climate zone. Division of the State Architect (DSA) documents referenced within this publication are available on the DSA Forms or DSA Publications webpages. This Interpretation of Regulations (IR) clarifies Photovoltaic (PV) and Battery/Energy Storage Systems (BESS) requirements of project submittals to promote. Previously, the code required that projects designate roof areas for future solar installations (Solar Ready) and reserve space for inverters, metering equipment, and pathways for conduits associated with a future PV system installation. Building on these previous requirements, Section 140. The global energy storage market nearly tripled in 2023, with utility-scale BESS projected to increase sixfold by 2029. Nevertheless, this rapid expansion now faces. With many factors increasing the need for reduced energy usage, lower emissions, and less dependency on fossil fuels, California's latest energy code has implemented stronger requirements for photovoltaic (PV) systems, with a large percentage of new buildings now requiring not only PV but also. The Large-scale Solar Association ("LSA") is a non-partisan association of solar and battery storage developers that advocates appropriate policies to enable market penetration of utility-scale solar technologies in California and the Western United States.
