

Elevator power generation wind

Overview

There are millions of elevators around the world. And they spend a significant amount of time sitting idle. Engineers in Austria now propose using those empty elevators in high-rise buildings as a way to store excess wind and solar energy. A wind power generation system using a stack effect of a high-speed elevator in a high-rise building is provided which includes: a wind turbine rotating with a wind generated from movement of an elevator car vertically moving in an internal space of an elevator core disposed in the high-rise. There are millions of elevators around the world. This inventive concept for gravity-based energy storage. Design a device that uses the power of wind to lift a small object. The power conversion between alternating current (AC) and direct current (DC) ensures the electricity flows circulating among the motor, the ESS, and the grid.
