

## Overview

---

Solar panels - also known as photovoltaic (PV) panels - are made from silicon, a semiconductor material. Such a material has some electrons which are only weakly bound to their atoms. When light falls on the surface of the silicon, electrons break free and can become part of. First used to generate power for early spacecraft, solar panels are now found all over the world, powering communities without generating carbon emissions. How do solar panels convert sunlight into electricity?
