

Power consumption of solar power generation in communication base stations

Overview

A typical 4G base station consumes between 2.5 to 6 kilowatts (kW) of power, averaging around 5 kW, translating to approximately 120 kilowatt-hours (kWh) per day. The rapid growth of mobile communication technology and the corresponding significant increase in the number of cellular base stations (BSs) have increased operational expenses (OPEX) for mobile operators, due to increased electricity prices and fossil fuel consumption. Thus, identifying. Integrating dedicated solar power systems presents a viable and eco-friendly alternative to traditional fossil fuel-based energy sources, aligning with global sustainability goals and reducing operational costs. The power generated by solar energy is used by the DC load of the base station computer room, and the insufficient power is supplemented by energy storage. Base station operators deploy a large number of distributed photovoltaics to solve the problems of high energy consumption and high electricity costs of 5G base stations. You know, the telecom industry's facing a perfect storm.
