

Principle of laser repair of photovoltaic panels

Overview

Laser edge deletion is a precise, non-contact technology used in thin-film solar panel manufacturing to remove conductive coatings from the edges of glass panels. This process prevents short circuits, enhances durability, and prepares panels for hermetic sealing by creating a clean glass surface. Furthermore, Fraunhofer ILT develops technology. We offer feasibility studies, process manufacturing lines. This technique is essential for enhancing the efficiency and performance of solar cells, providing a critical edge in the competitive field of. Researchers in Australia have developed a new laser-based technique that allows them to observe in real time how ultraviolet (UV) radiation damages silicon solar cells and how they can naturally repair themselves under sunlight. By combining optimized firing conditions with LECO "repair" of contacts, the approach balances recombination.
