

The power supply of the communication base station is cut off

Overview

This power supply has a secondary power - off function. In today's increasingly dense communication network coverage, the stability of base station power supply systems directly impacts signal transmission quality. As the "first line of defense" at the power access point, the drop out fuse plays a crucial role in high-voltage power distribution. The base station power cabinet is a key equipment ensuring continuous power supply to base station devices, with LLVD (Load Low Voltage Disconnect) and BLVD (Battery Low Voltage Disconnect) being two important protection mechanisms in the power cabinet. This article will provide a detailed analysis. These two tables provide guidance from the first indication of a fault, a poor Key Performance Indicator (KPI), to the BTS or Spectrum Master test, and finally, to the field replaceable unit. 5G networks also offer greater capacity to handle more traffic and greater consistency, which can unlock economic and societal opportunities. With those opportunities comes. The EverExceed base station system is equipped with an AC and DC system, which consists of an AC distribution box/panel, a -48V high-frequency switch combined power supply (including AC distribution unit, high-frequency switch rectifier module, monitoring module, DC distribution unit) and one (or.

LLVD & BLVD in Base Station Power Cabinets

As the battery charge gradually decreases and the output voltage drops to 40V, the comparator outputs a low level, the relay opens, cutting off the power supply to
