

Vanadium liquid flow battery volume

Overview

The volume of liquid electrolyte in storage tanks dictates the total battery energy storage capacity while the size and number of the reaction cell stacks dictate the battery power capacity. The vanadium redox battery (VRB), also known as the vanadium flow battery (VFB) or vanadium redox flow battery (VRFB), is a type of rechargeable flow battery which employs vanadium ions as charge carriers. The battery uses vanadium's ability to exist in a solution in four different oxidation states. Flow batteries are electrochemical cells, in which the reacting substances are stored in electrolyte solutions external to the battery cell. Electrolytes are pumped through the cells. Electrolytes flow across the electrodes. Reactions occur at the electrodes. Electrodes do not undergo a physical change. Vanadium redox flow batteries also known simply as Vanadium Redox Batteries (VRB) are secondary (i.e. VRB are applicable at grid scale and local user level). In a battery without bulk flow of the electrolyte,
