

# Why are there fewer liquid flow batteries in foreign communication base stations

## Overview

---

Lithium-ion batteries, particularly Lithium Iron Phosphate (LiFePO<sub>4</sub>), are dominating this sector due to their exceptional energy density, extended lifespan, and improved safety profiles compared to Nickel-Metal Hydride (NiMH) technology. With increasing demand for reliable data connectivity and the critical nature of emergency communications, maintaining battery health is essential. These unsung heroes handle 87% of global mobile traffic, yet many still rely on diesel generators that fail when needed most. Last month, a 12-hour outage in Mumbai disabled 78 towers, affecting 2 million users. Batteries in telecom aren't just backup power—they're an essential lifeline that bridges outages, supports remote monitoring systems, and ensures that communication. Telecom batteries for base stations are backup power systems using valve-regulated lead-acid (VRLA) or lithium-ion batteries. They ensure uninterrupted connectivity during grid failures by storing energy and discharging it when needed.
